

**ABSTRACT** We examine four identities from Ramanujan's Last Notebook. The first identity is related to Atkin and Swinnerton-Dyer's (1954) for Dyson's (1944) rank of a partition mod 5. The second identity gives a clue to the mysterious crank which was conjectured by Dyson to explain Ramanujan's partition congruence mod 11. The other two identities involve two of Ramanujan's mod theta functions of order 5. We find that all four identities are related.
