

```
> libname;  
"C:\Program Files\Maple 13/lib", "C:\Program Files\Maple 13/mylib" (1)
```

libname should contain the name of your local maple library directory.
This is set by the initialization file maple.ini which is in the directory
C:\Program Files\Maple 13\Users

```
> currentdir();  
"H:\maple\mypackages\bailey\wmprog" (2)
```

This lists the current directory. We change the current directory to the
directory which contains the file wmprog.txt

```
> currentdir("H:\\maple\\mypackages\\bailey\\wmprog");  
"H:\maple\mypackages\bailey\wmprog" (3)
```

```
> currentdir();  
"H:\maple\mypackages\bailey\wmprog" (4)
```

```
> system(dir);  
0 (5)
```

```
> read "bailey-wmprog-maple13-win.txt":  
BEGIN bailey package  
TABLE TYPE bailey = true  
END bailey package
```

No error was produced. Quit and restart maple to test the package.
