G. H. Hardy, A Mathematician's Apology

It is a melancholy experience for a professional mathematician to find himself writing about mathematics. The function of a mathematician is to do something, to prove new theorems, to add to mathematics, and not to talk about what he or other mathematicians have done. . . . Exposition, criticism, appreciation, is work for second-rate minds.

Definition

Ramanujan's general theta function $f(a, b)$ is defined by

$$f(a, b) := \sum_{n=-\infty}^{\infty} a^{n(n+1)/2} b^{n(n-1)/2}, \quad |ab| < 1.$$

Complete Elliptic Integral of the First Kind

$$K(k) := \int_0^{\pi/2} \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}},$$

where k , $0 < k < 1$, is the *modulus*.

Modular Equation

Definition

Let $K, K', L,$ and L' denote complete elliptic integrals of the first kind associated with the moduli $k, k' := \sqrt{1 - k^2}, \ell,$ and $\ell' := \sqrt{1 - \ell^2},$ respectively, where $0 < k, \ell < 1.$ Suppose that, for $n \in \mathbb{Z}^+,$

$$n \frac{K'}{K} = \frac{L'}{L}. \quad (1)$$

A relation between k and ℓ induced by (1) is called a **modular equation of degree n** . Set

$$\alpha = k^2 \quad \text{and} \quad \beta = \ell^2.$$

We often say that β has degree n over $\alpha.$

Main Theorem in Elliptic Functions

$$q = \exp(-\pi K'/K),$$

$$(a)_0 := 1, \quad (a)_n := a(a+1)\cdots(a+n-1), \quad n \geq 1.$$

$${}_2F_1(a, b; c; x) := \sum_{n=0}^{\infty} \frac{(a)_n (b)_n}{(c)_n n!} x^n, \quad |x| < 1.$$

$$\begin{aligned} \varphi^2(q) &= {}_2F_1\left(\frac{1}{2}, \frac{1}{2}; 1; k^2\right) \\ &= \frac{2}{\pi} \int_0^{\pi/2} \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}} =: \frac{2}{\pi} K(k). \end{aligned}$$

Multiplier

$$m = \frac{\varphi^2(q)}{\varphi^2(q^n)} = \frac{{}_2F_1\left(\frac{1}{2}, \frac{1}{2}; 1; \alpha\right)}{{}_2F_1\left(\frac{1}{2}, \frac{1}{2}; 1; \beta\right)}.$$

Examples of Modular Equations

$$z = \varphi^2(q), \quad z_n = \varphi^2(q^n)$$

Third Order

$$(\alpha\beta)^{1/4} + \{(1 - \alpha)(1 - \beta)\}^{1/4} = 1,$$

Seventh Order

$$(\alpha\beta)^{1/8} + \{(1 - \alpha)(1 - \beta)\}^{1/8} = 1.$$

Examples of Modular Equations

$$z = \varphi^2(q), \quad z_n = \varphi^2(q^n)$$

Can any of these transformation formulas be generalized by replacing the parameters $\frac{1}{2}$, $\frac{1}{2}$, 1 by functions of α and β ?

Sums of Theta Functions

Theorem (Entry 31, Chapter 16)

Let, for each positive integer n ,

$$U_n = a^{n(n+1)/2} b^{n(n-1)/2},$$

$$V_n = a^{n(n-1)/2} b^{n(n+1)/2}.$$

Then

$$f(a, b) = \sum_{r=0}^{n-1} U_r f\left(\frac{U_{n+r}}{U_r}, \frac{V_{n-r}}{U_r}\right).$$

Sums of Theta Functions

$$T(x, q) := \sum_{n=-\infty}^{\infty} x^n q^{n^2}, \quad x \neq 0, \quad |q| < 1$$

Theorem (Schröter's Formula)

For positive integers a, b ,

$$\begin{aligned} T(x, q^a) T(y, q^b) &= \sum_{n=0}^{a+b-1} y^n q^{bn^2} T(xyq^{2bn}, q^{a+b}) \\ &\quad \times T(x^{-b}y^a q^{2abn}, q^{ab^2+a^2b}). \end{aligned}$$

Sums of Theta Functions

If μ is an odd positive integer,

$$\begin{aligned} & \psi(q^{\mu+\nu})\psi(q^{\mu-\nu}) \\ &= q^{\mu^2/4-\mu/4}\psi(q^{2\mu(\mu^2-\nu^2)})f(q^{\mu+\mu\nu}, q^{\mu-\mu\nu}) \\ &+ \sum_{m=0}^{(\mu-3)/2} q^{\mu m(m+1)} f\left(q^{(\mu+2m+1)(\mu^2-\nu^2)},\right. \\ & \left. q^{(\mu-2m-1)(\mu^2-\nu^2)}\right) f(q^{\mu+\nu+2\nu m}, q^{\mu-\nu-2\nu m}). \end{aligned}$$

Eta Function Identities

$$(a; q)_{\infty} = \prod_{n=0}^{\infty} (1 - aq^n), \quad |q| < 1$$

$$f(-q) = (q; q)_{\infty} = e^{-2\pi i\tau/24} \eta(\tau), \quad q = e^{2\pi i\tau}.$$

Theorem

Let

$$P = \frac{f(-q)}{q^{1/4}f(-q^7)} \quad \text{and} \quad Q = \frac{f(-q^3)}{q^{3/4}f(-q^{21})}.$$

Then

Combinatorics of Theta Function Identities

$A(3) = 12 = B(3)$, with the twelve representations in odd and even elements being given respectively by

$$\begin{aligned}5_o + 1_o &= 5_o + 1_b = 5_o + 1_r = 5_b + 1_o = 5_b + 1_b \\ &= 5_b + 1_r = 5_r + 1_o = 5_r + 1_b \\ &= 5_r + 1_r = 3_o + 3_b = 3_o + 1_o + 1_b + 1_r \\ &= 3_b + 1_o + 1_b + 1_r,\end{aligned}$$

My Mother's First Birthday

G. H. Hardy to Ramanujan

26 March 1913

What I should like above all is a definite proof of some of your results concerning continued fractions of the type

$$\frac{x}{1} + \frac{x^2}{1} + \frac{x^3}{1} + \dots;$$

and I am quite sure that the wisest thing you can do, in your own interests, is to let me have one as soon as possible.

How to Spend Christmas Eve

G. H. Hardy to Ramanujan

24 December 1913

If you will send me your proof written out carefully (so that it is easy to follow), I will (assuming that I agree with it—of which I have very little doubt) try to get it published for you in England. Write it in the form of a paper ‘On the continued fraction

$$\frac{x}{1} + \frac{x^2}{1} + \frac{x^3}{1} + \dots,$$

giving a full proof of the principal and most remarkable theorem, viz. that the fraction can be expressed in finite terms when $x = e^{-\pi\sqrt{n}}$, when \underline{n} is rational.

The Rogers–Ramanujan Functions

$$G(q) := \sum_{n=0}^{\infty} \frac{q^{n^2}}{(q; q)_n}$$
$$H(q) := \sum_{n=0}^{\infty} \frac{q^{n(n+1)}}{(q; q)_n}.$$

The Rogers–Ramanujan Functions

$$H(q) := \sum_{n=0}^{\infty} \frac{q^{n(n+1)}}{(q; q)_n}.$$

I discovered very interesting functions recently which I call “Mock” ϑ -functions. Unlike the “False” ϑ -functions (studied partially by Prof. Rogers in his interesting paper) they enter into mathematics as beautifully as the ordinary ϑ -functions.
